Solstream

Pay-per-second streaming payments for freelancers and creators on Solana

The Problem & Our Solution

Freelancers and creators wait for lump-sum payments, creating trust gaps and cash flow strain in continuous work relationships.

- Traditional invoicing pays in delayed lump sums, not as work actually happens
- Freelancers, DAOs, and API providers need continuous, verifiable payment flows
- Solstream streams payments per second on Solana, so funds accrue live
- Recipients withdraw anytime; either side can pause or cancel with fair settlement

How It Works

A payer opens a stream; funds accrue every second on-chain, and the payee can withdraw anytime, fully transparent to both sides.

- Payer sets rate, token, and duration to create a stream via an Anchor program
- Solana program continuously computes and releases funds in real time
- Dashboard shows live balance accrual to both payer and payee
- Pause or cancel triggers pro-rata settlement, avoiding disputes
- Embeddable widget lets any website accept streamed payments

Built with

Solana, Anchor, Rust, React, TypeScript, Solana Pay, Phantom Wallet Adapter

Why Now & What's Next

Solana's speed and near-zero fees finally make per-second micropayments practical, unlike on other chains.

- Sub-second finality and low fees enable real-time streaming at scale
- Growing freelance, DAO, and creator economies need continuous payment tools
- Next: multi-token and stablecoin streams for stable income
- Next: API integrations with existing freelance platforms
- Next: recurring subscription templates for SaaS billing
